

Solution Benefits

- Eliminates time lags between field action and stakeholders awareness
- Automate time-consuming and error prone manual processes
- Reach higher operational efficiencies by managing utilization of assets and resources more effectively
- Boost revenue with automated billing
- Reduce errors by sensing, capturing, notifying and reacting to various events through workflow automation and BRE
- Replay scenarios and report on historical events
- Schedule and opt-in to receive notifications through voice, email, and SMS

RFID-based logistics that work in different environments

With the increased need for visibility into broad supply chain processes and demands needed to meet service-level commitments, most logistics providers view the role of RFID-based logistic services as paramount to their organization's growth and efficiency. A holistic approach underlines the benefits for adoption of a technology-agnostic solution that could effectively work in various environments while providing complete visibility from source to destination, including critical points along the way.

Challenged by the transportation issues and an inability to gain visibility into product flows, logistics companies are continuously facing problems serving verticals with high product value and strict regulatory requirements. Also, challenged by the continuous need to optimize operations, reduce theft/misplaced assets, and maximize asset utilization, logistics companies can better serve their customers with real-time and accurate information on the whereabouts and status of their assets. AiRISTA Flow offers solutions for:

- Shipment & cargo container tracking
- Asset & personnel tracking for safety and security
- Supply chain visibility
- Improving how gas cylinders are shipped, distributed, tracked, and monitored
- Yard and fleet management

AiRISTA Flow solutions bring about the ability to capture and fuse data from various sources. These include data captured through passive, battery-assisted, and active RFID tags with various on-board sensors for detection of position, temperature, and motion. Data may be then fused with additional data transmitted by GPS devices using cellular or satellite networks. With AiRISTA Flow's Universal Visibility Solution, it's easy to pinpoint assets on maps, and to send notifications of various events including those of arrivals, departures, staging, loading, and unloading for shipments or cargo on board vessels or moving into trucks.
